

Novelty Override Failures.

The previously validated configuration remains the production baseline for normal request traffic.

The previously validated configuration failed when burst traffic introduced a new skewed tenant mix.

The adaptive freshness budget regressed for the new archival workload and increased stale answers by 18 percent.

The familiar reranking setup produced a new latency quality tradeoff, increasing recall by 6 percent but doubling tail latency.

Novelty Override Conditions.

Standard hybrid retrieval combines lexical and semantic candidates during routine operation.

Unlike the baseline, standard hybrid retrieval under the distribution shift reduced rare-query recall by 14 percent.

The adaptive freshness budget was already validated for the ordinary workload and adds no new evidence.

Vendor pricing lists annual support tiers for the deployment.
